

Error Analysis Task

Here's a ready-to-use error analysis task. Students get a flawed "analyst report" and must find, classify, and correct the errors.

Instructions to students: A new intern wrote the report below. It contains **8 errors**. Find each one, state why it's wrong, and write the corrected version.

Intern's Report:

1. "I gave the CISO a **strategic intelligence** report containing the file hashes and C2 IP addresses of the latest malware campaign, so she can plan next year's security budget."
 2. "**Tactical intelligence** is meant for board members and focuses on long-term risk trends, geopolitical threats, and industry-wide attack patterns."
 3. "**Operational intelligence** tells us nothing about specific campaigns — it's just a list of blocked IPs."
 4. "Strategic intelligence has the shortest lifespan of all types, since attacker infrastructure changes daily."
 5. "The threat intelligence lifecycle begins with **Collection** — first gather all data possible from every feed, then decide what questions we need answered."
 6. "In the **Processing** stage, analysts interpret the data, draw conclusions about attacker intent, and produce finished reports for stakeholders."
 7. "**Dissemination** means storing the finished intelligence in a database in case anyone asks for it later. The same report format works for everyone — SOC analysts and the CEO get the identical document."
 8. "Once intelligence is disseminated, the lifecycle is complete. **Feedback** is optional and rarely changes anything."
